

PicoScope® 9300 Series®

The new face of sampling oscilloscopes

Up to 25 GHz bandwidth Electrical, optical, TDR/TDT and 4-channel models

Key features

15 TS/s (64 fs) sequential sampling
Up to 15 GHz prescaled, 2.5 GHz direct trigger and 11.3 Gb/s clock recovery
Industry-leading 16-bit 1 MS/s ADC and 60 dB dynamic range
Eye and mask testing to 16 Gb/s with up to 2²³–1 pattern lock
Intuitive, touch-compatible Windows user interface
Comprehensive built-in measurements, histogramming and editable data mask library
Integrated, differential, deskewable TDR/TDT step generator

Applications include:

Telecom and radar test, service and manufacturing
Optical fiber, transceiver and laser testing
RF, microwave and gigabit digital system measurements
Ethernet, HDMI 1 and 2, USB 2 and 3, PCI, SATA
Semiconductor characterization
TDR/TDT analysis of cables, connectors, backplanes, PCBs and networks

Designed for ease of use

The PicoSample 3 workspace takes full advantage of your available display size and resolution. You decide how much space to give to the trace display and the measurements display, and whether to open or hide the control menus. The user interface is fully touch- or mouse-operable, with grabbing and dragging of traces, cursors, regions and parameters. There are enlarged parameter controls for use on smaller touch displays. To zoom, either draw a zoom window or use the more traditional dual timebase, delay and scaling controls.

A choice of screen formats

When working with multiple traces, you can display them all on one grid or separate them into two or four grids. You can also plot signals in XY mode with or without additional voltage-time grids. The persistence display modes use color-coding or shading to show statistical variations in the signal. Trace display can be in either dots-only or vector format.

Up to 25 GHz electrical bandwidth

The PicoScope 9300 series offers models at 15, 20 and 25 GHz with low sampling jitter and fine timing resolution to support measurement of transitions down to 14 ps (calculated). Among the fastest of all sampling oscilloscopes, the 9300 Series captures your waveform at up to 1 MS/s with timing resolution down to 64 fs and with 16-bit vertical resolution. It achieves lively trace, persistence and eye updates, greater than 60 dB dynamic range, and trace lengths up to 32 kS.

Trigger modes

- 2.5 GHz direct and up to 15 GHz prescaled trigger
 Sampling oscilloscopes accept their trigger from a separate input, either directly for
 repetition rates up to 2.5 GHz or via a prescaling divider input, for repetition rates up
 to 15 GHz (14 GHz on 15 and 20 GHz models).
- Built-in 11.3 Gb/s clock data recovery trigger
 To support serial data applications in which the data clock is not available as a
 trigger, or for which trigger jitter needs to be reduced, the PicoScope 9302 and 9321
 include a clock recovery module. This continuously regenerates the data clock from
 the incoming serial data or trigger signal and can do so with reduced jitter even over
 very long trigger delays or for pattern lock applications. A divider accessory kit is
 included to route the signal to both the clock recovery and oscilloscope inputs.

Eye-diagram analysis

The PicoScope 9300 Series scopes quickly measure more than 30 fundamental parameters used to characterize non-return-to-zero (NRZ) signals and return-to-zero (RZ) signals. Up to ten parameters can be measured simultaneously, with comprehensive statistics also shown.

The measurement points and levels used to generate each parameter can optionally be drawn on the trace.

Eye-diagram analysis can be made even more powerful with the addition of mask testing, as described later in this data sheet.

Pattern sync trigger and eye line mode

When a repeating data pattern such as a pseudorandom bit sequence is present, an internal trigger divider can lock to it. You can then use eye-line mode to move the trigger point, and view point, along the whole pattern, bit by bit.

Eye-line scan mode is also available to build an eye diagram from a user-selected range of bit intervals through to the whole pattern. These features are useful for analyzing data-dependent waveshapes.

Mask testing

PicoSample 3 has a built-in library of over 160 masks for testing data eyes. It can count or capture mask hits or route them to an alarm or acquisition control. You can stress test against a mask using a specified margin, and locally compile or edit masks.

There's a choice of gray-scale and color-graded display modes to aid in analyzing noise and jitter in eye diagrams. There is also a statistical display showing a failure count for both the original mask and the margin.

The extensive menu of built-in test waveforms is invaluable for checking your mask test setup before using it on live signals.

Mask test features

- Failure count
- User-defined margins
- Count fails
- Built-in standard test waveforms
- Stop on fail

9.5 GHz optical model

The PicoScope 9321-20 includes a built-in precision optical-to-electrical converter. With the converter output routed to one of the scope inputs (optionally through an SMA pulse shaping filter), the PicoScope 9321-20 can analyze standard optical communications signals such as OC48/STM16, 4.250 Gb/s Fibre Channel and 2xGB Ethernet. The scope can perform eyediagram measurements with automatic measurement of optical parameters including extinction ratio, S/N ratio, eye height and eye width. With its integrated clock recovery module, the scope is usable to 11.3 Gb/s.

The converter input accepts both single-mode (SM) and multi-mode (MM) fibers and has a wavelength range of 750 to 1650 nm.

TDR/TDT analysis

The PicoScope 9311 oscilloscopes feature built-in step generators for time-domain reflectometry and transmission measurements. The 9311-15 integrates a single rising step generator suited to single-ended TDR/TDT applications, while the 9311-20 features deskewable rising and falling step generators suited to single-ended and differential measurements. These features can be used to characterize transmission lines, printed circuit traces, connectors and cables with 16 mm resolution for impedance measurements and 4 mm resolution for fault detection.

Connection diagrams: PicoScope 9311 sampling oscilloscopes in use with devices under test (DUT) in TDR and TDT applications

The PicoScope 9311-15 and 9311-20 generate 2.5 to 7 V steps with 60 ps rise time from built-in step recovery diodes. They are supplied with a comprehensive set of calibrated accessories to support your TDR/TDT measurements, including cables, signal dividers, adaptors, attenuator and reference load and short.

The PicoScope 9311-20 TDR/TDT model includes source deskew with 1 ps resolution and comprehensive calibration, reference plane and measurement functions. Voltage, impedance or reflection coefficient (ρ) can be plotted against time or distance.

An alternative approach to TDR/TDT capability is to pair any 9300 Series scope with a standalone PG900 pulse generator. These instruments include similar differential step recovery diode step generators and also offer an option of 40 ps tunnel diode step generation. This brings extra flexibility and the ability to remotely position the pulse source. The generators also enable TDT and TDR with the PicoScope 9301, 9302 clock recovery, 9321 optical and 9341 4-channel sampling oscilloscopes.

See back page for ordering details.

PicoConnect® 900 Series: the shape of probes to come

The PicoConnect 900 Series is a range of low-invasive, high-frequency passive probes, designed for microwave and gigabit applications up to 9 GHz and 18 Gb/s. They deliver unprecedented performance and flexibility at a low price and are an obvious choice to use alongside the PicoScope 9300 Series scopes.

A breakthrough in cost and convenience

Until now, the majority of 1 GHz test probes have been of familiar probe shape but with an active buffer amplifier within the probe body. They are mechanically complex, quite bulky, often heavy and always costly.

In a survey of all available active probe models between 3 GHz and 30 GHz, we found that list prices were around \$1000 + \$1000/GHz or higher, a figure which then multiplies with the number of signal channels to be probed. The PicoConnect 900 Series passive probes are all priced around \$100 + \$150/GHz, less when purchased as a kit: that is less than one sixth of the cost per channel!

Soldered-in PicoConnect 900 Series probes working with a PicoScope 9300 Series sampling oscilloscope to capture an HDMI signal

Features of the PicoConnect 900 Series probes

- Extremely low loading capacitance of < 0.3 pF typical, 0.4 pF upper test limit for all models
- Slim, fingertip design for accurate and steady probing or solder-in at fine scale
- Interchangeable SMA probe heads at division ratios of 5:1, 10:1 and 20:1, AC or DC coupled
- Accurate probing of high speed transmission lines for $Z_0 = 0 \Omega$ to 100Ω
- Specified probe ratio compensated to correct for loading of the low-impedance probe input
- Class-leading uncorrected pulse/eye response and pulse/eye disturbance
- High dynamic range, low noise, and implicit linearity and long-term flatness of a passive design
- Tolerant of very high input slew rate, hardened to EM discharge and no saturation and recovery characteristic. Can address high-amplitude pulse and burst applications.
- Screened to minimize noise or response change caused by finger proximity or EM interference
- Supplied with robust, high-performance, highly flexible low-loss microwave coaxial cable

Ultra-compact: the probe head is just 68 mm long and weighs only 5 g

Measurement of over 100 waveform parameters with and without statistics

The PicoScope 9300 Series scopes quickly measure well over 100 standard waveform and eye parameters, either for the whole waveform or constrained between markers. The markers can also make on-screen ruler measurements, so you don't need to count graticules or estimate the waveform's position. Up to ten simultaneous measurements are possible. The measurements conform to IEEE standard definitions, but you can edit them for non-standard thresholds and reference levels using the advanced menu or by dragging the on-screen thresholds and levels. You can apply limit tests to up to four measured parameters.

A dedicated frequency counter shows signal frequency at all times, regardless of measurement and timebase settings.

Powerful mathematical analysis

The PicoScope 9300 Series scopes support up to four simultaneous mathematical combinations or functional transformations of acquired waveforms.

You can select any of the mathematical functions to operate on either one or two sources. All functions can operate on live waveforms, waveform memories or even other functions. There is also a comprehensive equation editor for creating custom functions of any combination of source waveforms.

FFT analysis

All PicoScope 9300 Series oscilloscopes can calculate real, imaginary and complex Fast Fourier Transforms of input signals using a range of windowing functions. The results can be further processed using the math functions. FFTs are useful for finding crosstalk and distortion problems, adjusting filter circuits designed to filter out certain harmonics in a waveform, testing impulse responses of systems, and identifying and locating noise and interference sources.

Choose from 61 math functions, or create your own

Histogram analysis

Behind the powerful measurement and display capabilities of the 9300 Series lies a fast, efficient data histogramming capability. A powerful visualization and analysis tool in its own right, the histogram is a probability graph that shows the distribution of acquired data from a source within a user-definable window.

Histograms can be constructed on waveforms on either the vertical or horizontal axes. The most common use for a vertical histogram is measuring and characterizing noise and pulse parameters. A horizontal histogram is typically used to measure and characterize jitter.

Compact, portable USB instruments

These units occupy very little space on your workbench and are small enough to carry with your laptop for on-site testing, but that's not all. Instead of using remote probe heads attached to a large bench-top unit, you can now position the scope right next to the device under test. Now all that lies between your scope and the DUT is a short, low-loss coaxial cable. Everything you need is built into the oscilloscope, with no expensive hardware or software add-ons to worry about.

Software Development Kit

The PicoSample 3 software can operate as a stand-alone oscilloscope program or under ActiveX remote control. The ActiveX control conforms to the Windows COM interface standard so that you can embed it in your own software. Unlike more complex driver-based programming methods, ActiveX commands are text strings that are easy to create in any programming environment. Programming examples are provided in Visual Basic (VB.NET), MATLAB, LabVIEW and Delphi, but you can use any programming language or standard that supports the COM interface, including JavaScript and C. National Instruments LabVIEW drivers are also available. All the functions of the PicoScope 9300 and the PicoSample software are accessible remotely.

We supply a comprehensive programmer's guide that details every function of the ActiveX control. The SDK can control the oscilloscope over the USB or the LAN port.

Built-in signal generator

All the PicoScope 9300 Series scopes can generate industry-standard and custom signals including clock, pulse and pseudo-random binary sequence. You can use these to test the instrument's inputs, experiment with its features and verify complex setups such as mask tests. AUX OUTPUT can also be configured as a trigger output.

PicoSource® PG900 Series differential pulse generators

For greater versatility than a built-in signal generator can offer, you may want to separate your high-performance fast-step TDR/TDT pulse source from the sampling oscilloscope and have two instruments to use either stand-alone or together as required. The PicoSource PG900 Series generators contain the same step recovery diode pulse source as the PicoScope 9311, or slightly faster but reduced amplitude tunnel diode pulse heads, rehoused in a separate USB-controlled instrument. All are supplied with PicoSource PG900 control software.

Choose from three models

- PicoSource PG911 with integrated 60 ps pulse outputs
- PicoSource PG912 with 40 ps pulse tunnel diode heads
- PicoSource PG914 with both types of output

Intuitive Windows-based software

Key specifications

PicoSource PG911 and PG914

- Integrated 50 Ω SMA(f) step recovery diode outputs
- < 60 ps single-ended pulse transition time
- Two 2.5 V to 7 V variable amplitude outputs
- ±1 ns timing deskew in 1 ps steps
- 20 dB 10 GHz SMA(m-f) attenuators supplied fitted to SRD pulse outputs

PicoSource PG912 and PG914

- External 50 Ω N(m) positive and negative tunnel diode pulse heads
- < 40 ps pulse transition time
- Fixed 200 mV output amplitude
- ±500 ps timing deskew in 1 ps steps
- Inter-series N(f)-SMA(m) adaptors included with pulse heads

All PicoSource PG900 models

- Differential outputs
- 200 ns to 4 μs pulse width
- Adjustable 1 μs to 1 s internal clock period
- Typical 3.0 ps RMS jitter relative to external trigger

SMA Bessel-Thomson pulse-shaping filters

For use with the 9321-20 optical to electrical converter, a range of Bessel-Thomson filters is available for standard bit rates. These filters are essential for accurate characterization of signals emerging from an optical transmission system.

O/E converter output, raw

Above is the ringing typical of an unequalized O/E converter output at 622 Mb/s.

O/E converter output, filtered

Above is the result of connecting the 622 Mb/s B-T filter. This is an accurate representation of the signal that an equalized optical receiver would see, enabling the PicoScope 9321-20 to display correct measurements.

OPTICAL/ELECTRICAL CONVERTER (PICOSCOPE	9321-20)
Bandwidth (-3 dB)	9.5 GHz typical
Effective wavelength range	750 nm to 1650 nm
Calibrated wavelengths	850 nm (MM), 1310 nm (MM/SM), 1550 nm (SM)
Transition time	51 ps typical (10% to 90% calculated from $T_R = 0.48/\text{optical BW}$)
Noise	4 μW (1310 & 1550 nm), 6 μW (850 nm) maximum @ full electrical bandwidth
DC accuracy	±25 µW ±10% of full scale
Maximum input peak power	+7 dBm (1310 nm)
Fiber input	Single-mode (SM) or multi-mode (MM)
Fiber input connector	FC/PC
Input return loss	SM: -24 dB typical MM: -16 dB typical, -14 dB maximum
GENERAL	
Temperature range, operating	+5 °C to +35 °C
Temperature range for stated accuracy	Within 2 °C of last autocalibration
Temperature range, storage	-20 °C to +50 °C
Calibration validity period	1 year
Power supply voltage	+12 V DC ± 5%
Power supply current	1.7 A max.
Mains adaptor	Universal adaptor supplied
PC connection	USB 2.0 (compatible with USB 3.0)
LAN connection	10/100 Mbit/s
PC requirements	Microsoft Windows XP (SP2 or SP3), Vista, 7, 8 or 10. 32-bit or 64-bit versions.
Dimensions	170 mm x 285 mm x 40 mm (W x D x H)
Weight	1.3 kg max.
Compliance	FCC (EMC), CE (EMC and LVD)

More detailed specifications can be found in the *PicoScope 9300 Series User's Guide*, available from www.picotech.com/downloads.

Warranty 5 years

Kit contents (all models)

- Picoscope 9300 Series PC sampling oscilloscope
- PicoSample™ 3 software CD
- Quick Start Guide
- 12 V power supply, universal input
- Localized mains lead (line cord)
- USB cable, 1.8 m
- SMA / PC3.5 / 2.92 wrench
- Storage and carry case
- LAN cable, 1 m

Kit contents (model-dependent)
